

Completion Receipt™ #001 Public Flagship Evidence Dossier

66.4 min

OBSERVED PROJECT WINDOW

Documented runtime artifact window —
not compute time.

44 hrs

MODELED TRADITIONAL MIDPOINT

Midpoint human-equivalent scenario
— not observed history.

Exact planning subject SHA-256
40a563a4b79d23a1ca2edc71c6055ed1774ada4209440abe4ad2ef895ac70268

Public-safe derivative. Protected UBuildOS™ internals are intentionally excluded.

Executive Receipt

10-second scan: what happened, what it means, and what it does not mean.

OBSERVED WINDOW 66.4 min Measured from project artifacts.	TRADITIONAL MODEL 28–64 hrs Modeled comparable human effort.	MIDPOINT 44 hrs Modeled midpoint.	REPLACEMENT COST \$2.1k–\$4.8k Modeled labor cost, not savings.
COMPRESSION 39.8× Modeled midpoint scenario.	INDEPENDENT REVIEW PASS Exact planning subject.	COLD RESTORE 56/56 All package files restored.	500× STATUS TARGET Not a public claim.

This dossier is designed for skeptical readers: the headline numbers are separated from their assumptions, limits, sources, and independent-review evidence. The goal is not to make the project sound bigger. The goal is to make it inspectable.

What We Set Out to Do

A public build campaign had to be useful, downloadable, testable — and safe to publish.

OUTCOME

A 30-day UBuildOS™ campaign plan for public-safe, downloadable, testable projects — with quality, rights, evidence, and publication controls built in.

The plan had to connect product releases, public proof, The first independently reviewed candidate failed because rights checks, recovery, and independent review. its validator could falsely pass bad metadata. The failure was preserved and repaired.

The release needed enough evidence for outsiders to inspect the claims while keeping proprietary UBuildOS™ internals, credentials, private prompts, and reconstruction-sensitive architecture out of the public package.

CREATE A COMPLETE PUBLIC-BUILD

PLAN

MORE THAN A CONTENT CALENDAR A REAL FAILURE STAYED VISIBLE

USEFUL PROOF WITHOUT EXPOSING PRIVATE

MECHANICS

Public project scale 27 requirements • 31 Day 0–30 records • 21 source files in review • 56-file independently reviewed planning package

The Public Build Blueprint

What the campaign plan had to cover before anything could be released.

CAMPAIGN STRUCTURE PUBLIC-SAFE REPOSITORY

RULES

30 days, one or more public releases per day as feasible. Only approved public outputs go to GitHub; no private prompts, secrets, or internal notes.

RIGHTS & ATTRIBUTION EVIDENCE &

MEASUREMENT

Every public artifact must be attributable and rights-safe. Measured, documented, modeled, inferred, and unknown values stay distinct.

DAILY RELEASE STANDARD RECOVERY &

VERIFICATION

Each product shows the problem, output, tests, limitations, and A release is not complete just because files exist; restore and download path. independent review matter too.

Why this matters to the public: the same rules are meant to make every release understandable, testable, and accountable — not merely impressive-looking.

The First Version Failed — and That Was Useful

Independent review found a real weakness before publication.

First candidate 1

Independent review found that the validator could approve bad manifest metadata.

Preserve 2

The failed version was kept intact instead of overwritten.

Repair 3

The entire failure family, including sibling cases, was addressed.

Recheck 4

The successor was independently reviewed again and passed.

Public takeaway: independent review is valuable precisely because it can disagree with the build process. A failure caught before publication can strengthen the release instead of damaging it.

How the Result Was Challenged

The proof is more useful when readers can see what was actually checked.

PACKAGE FILES SOURCE

ARTIFACTS

56/56

matched 21/21 recomputable

Every file in the planning package was independently recomputed. All source files included in review could be independently checked.

ADVERSARIAL TESTS CLEAN

RERUNS

Known cases detected Two unchanged-candidate sweeps Known false-PASS cases were deliberately introduced and The final candidate was rerun without changing its bytes. rejected.

COLD RESTORE INDEPENDENT

REVIEW

56/56 PASS

PASS

The package was restored and checked against the expected state. The exact planning subject passed a separate independent review.

Plain English: the project did not only ask "does it work?" It also asked "can the checker be fooled, can the package be restored, and can another reviewer reproduce the result?"

What the Numbers Mean

Measured time and modeled economics are deliberately kept separate.

OBSERVED PROJECT WINDOW	Measured from artifact timestamps. Not compute time. 66.4 min
TRADITIONAL LABOR SCENARIO	Modeled low / midpoint / high. 28 / 44 / 64 hrs
TRADITIONAL REPLACEMENT COST	Modeled labor replacement cost. Not savings. \$2,090.65 / \$3,291.09 / \$4,811.52
AI-ASSISTED MIDPOINT	Modeled using published productivity studies. 34.58 hrs / \$2,534.20
500×	No 500× performance claim is made. Target only
Economic boundary: replacement cost ≠ savings ≠ revenue ≠ valuation ≠ market price. Actual project-specific spend was not available, so proven cash savings are not claimed.	

How to Read the Claims

A public reader should not need internal terminology to know what is solid and what is estimated.

MEASURED DOCUMENTED	Recomputed from project evidence, such as file counts, Recorded in project evidence but not necessarily recomputed hashes, restore results, or artifact timestamps. in this public artifact.
MODELED INDEPENDENT REVIEW	A scenario built from assumptions and public benchmark data. A result returned by a separate reviewer for the exact submitted subject.
UNKNOWN TARGET	Not evidenced enough to state as fact. A goal, not a demonstrated result.

What UBuildOS™ Handled

Public-safe capability view — what the system coordinated without exposing proprietary mechanics.

Sources Behind the Economic Model

Evidence Behind the Headline

What supports each high-value public statement.

66.4-minute window	Evidence Audit record + artifact timestamps Boundary Measured project window; not compute time.
28-64 human hours	Evidence Task decomposition + public compensation benchmarks Boundary Modeled scenario.
\$2.1k-\$4.8k replacement cost	Evidence Role-hour model + BLS compensation sources Boundary Modeled replacement cost; not savings.
Independent review PASS	Evidence Exact-subject independent review record Boundary Applies to the planning subject only.
First failure closed	Evidence Preserved failed version + successor retest Boundary Public-safe summary of the repair history.
No 500× claim	Evidence Public claim boundary Boundary 500× remains a target.

Why Recovery Matters

"We have a backup" is weaker than "we restored it and checked the result."

Backup exists 1 A preserved copy is available.

Integrity checked 2 The preserved copy matches what was expected.

Restore tested 3 The package was actually restored.

Restored state verified 4 The restored output was checked against the expected state.

The public release reports the result of those checks without exposing private restore locations, credentials, or internal recovery machinery.

What We Publish — and What We Don't

Useful proof should not require publishing secrets or proprietary mechanics.

PUBLISHED NOT PUBLISHED	Public-safe metrics Private prompts
Source URLs Credentials or .env files	Limitations and non-claims Private system-control logic
Case-study narrative Private QA machinery	Audit workbook Customer/private data
Release hashes Reconstruction-sensitive architecture	

Limitations / Non-Claims

Trust depends on saying what the evidence does not establish.

The 30-day campaign itself is not completed by this planning project. 1

66.4 minutes is a runtime artifact window, not complete human time or model compute time. 2

Actual project-specific cash spend was not documented, so proven cash savings are not calculable. 3

Human-equivalent labor is a modeled scenario, not an observed historical comparator. 4

The AI-assisted comparison uses public studies with different task populations. 5

500×
remains a target and is not claimed here. 6

The public release intentionally withholds proprietary UBuildOS™ internals. 7

How to Inspect This Release

Start with the story, then drill into the numbers and evidence.

1. Case study PDF The full public story, evidence, sources, limits, and lessons.

2. Carousel PDF The five-slide social summary.

3. Audit workbook Inputs, calculations, public sources, and claim boundaries you can inspect.

4. Methodology How the time, labor, cost, and AI-assisted scenarios were constructed.

5. Verification Exact subject identities, hashes, and review scope.

6. Rights notice What this package does and does not license or disclose.

7. Release manifest Exact public file list and hashes.

A skeptical reader should be able to move from headline → method → sources → exact evidence without needing access to private UBuildOS™ internals.

What Anyone Can Take From This Project

Seven practical lessons for people using AI to produce real work.

1. Fast output is not finished work. A result is not done until it satisfies the goal and survives checking.

2. Independent review changes the quality of the result. A separate reviewer can catch assumptions the builder misses.

3. Failures can improve the system. A failed check is useful when the weakness is preserved, understood, and prevented from recurring.

4. Measure what happened — and label estimates. Observed time, modeled labor, replacement cost, and actual spend are different things.

5. Show the evidence behind the headline. Give readers enough information to inspect the basis of a speed, cost, or completion claim.

6. Keep private process separate from public proof. Publish the result, method, limits, and evidence — not proprietary internals.

7. The goal is not more AI output. The goal is reliable movement from INTAKE → DONE.

Closing

Completion Receipt™ #001

INTAKE

→ DONE This project is not asking you to believe an AI speed claim. It gives you a public-safe receipt: the outcome, the failure, the repair, the sources, the limitations, the modeled economics, the recovery evidence, and the independent-review boundary.

Built with UBuildOS™ by BRAIZ Works
